VARIABLES

Let your computer know what it needs to remember

A variable has a **Name** and a **Value**

```
A = 25
```

Name — Value

Names

→ The name associated to the variable

→ Can't be changed

Values

→ Can be a number, a word, a function, and much more!

→ Can only be one thing at a time

→ Can be changed

Copying and swapping

Values can be copied between variables.
The computer reads **one line at a time**. Once a line has been read, **it never goes back** to change it. If a variable is given a new value, the **old value is discarded**.

Example 1 (Copying)

```
A = 25
B = A
```

A is given value 25

B is given same value as A

A is now 25 and B is also 25.

Example 2 (Swapping)

```
A = 25
B = 50
C = A
A = B
B = C
```

C copies A's value

A discards its old value and copies B

B discards its old value and copies C

A is now 50, B is 25 and C was used as a temporary variable to help swap values.
